Σ
A Library for ANSI Common Lisp

Introduction

The Σ library is a generic library of mostly random useful code for ANSI Common Lisp. It is currently only really focused on SBCL, but patches to add support for other systems are more than welcome.

This library started out as a single file, `utilities.lisp`, that I personally used for shared generic code for all of my Lisp code. Most lispers have a similar file of some name, `utilities.lisp`, `misc.lisp`, `shared.lisp`, or even `stuff.lisp`, that is just a random collection of useful little generic macros and functions. Mine has grown over the years, and in 2012 I decided that I should try to make it useful to people other than myself.

You can download the library from GitHub at:
`https://github.com/cgore/sigma`
and I have some other information on it at my own website at:
`http://cgore.com/programming/lisp/sigma/`

Getting Lisp

Before using this library you need a working Lisp. I use and recommend SBCL, Steel Bank Common Lisp, which is available at:
`http://www.sbcl.org`
This is derived from CMUCL, Carnegie Mellon University Common Lisp, which is still under active development and is: available at:
`http://www.cons.org/cmucl/`

SBCL has information on getting started at:
`http://www.sbcl.org/getting.html`
If you are using Debian or a similar Linux distribution (including Ubuntu), you can just run as root:
`apt-get install sbcl sbcl-doc sbcl-source`

Getting EMACS and SLIME

After installing, the best way to interact with any Common Lisp is via SLIME, the Superior Lisp Interaction Mode for EMACS, which is avail-

able at:

```
http://common-lisp.net/project/slime/
```

This can be installed on Debian by:

```
apt-get install slime emacs emacs-goodies-el
```

Using the Library

First we need to clone the utilities.

```
mkdir -p  /programming/lisp
cd  /programming/lisp
git clone git@github.com:cgore/sigma.git
```

Now we need to make a directory for our project and symlink to the ASDF definition. There are other ways to load ASDF libraries, especially if you want to have them available globally; I strongly recommend you read the documentation to ASDF.

```
mkdir our-new-project
cd our-new-project
ln -s  /programming/lisp/sigma/sigma.asd
```

Now we need to start up our Lisp REPL. The best way to do this for perfonal use is SLIME from within Emacs, but I will demonstrate using the shell itself here.

```
sbcl
```

Now we are in SBCL. Let's calculate something.

$$\sum_{i=0}^{100} i$$

```
(require :asdf)} ; Require ASDF
(require :sigma) ; Require the Sigma system via ASDF.
(sigma:use-all-sigma) ; This will pollute COMMON-LISP-USER.
(sum (loop for i from 1 to 100
           collect i)) ; Returns 5050, and makes Euler sad.
```

Have fun!

Chapter 1

The `sigma/behave` Package

The `sigma/behave` package contains some useful code for confirming behavior of code, supporting a very basic form of *behavior-driven development*, BDD. The basic flow is to define the *behavior* of something, with multiple *specs* specified within that behavior specification, each consisting of various assertions, such as `should=`, `should-equal`, `should-not-equal`, and many others. If the behavior of the thing doesn't match the specified behavior, then there is some error.

1.1 Macros

1.1.1 The `behavior` Macro

The `behavior` macro is used to specify a block of expected behavior for a `thing`. It specifies an example group, loosely similar to the `describe` blocks in Ruby's RSpec. It takes a single argument, the `thing` we are trying to describe, and then a body of code to evaluate that is evaluated in an implicit `progn`. It is to be used around a set of examples, or around a set of assertions directly.

Syntax

```
(behavior thing &body body)
```

Arguments and Values

thing This is what we are describing the behavior of.

body This is an implicit proc to contain the behavior.

Examples

```
(behavior 'float
         (spec "is an Abelian group"
              (let ((a (random 10.0))
                    (b (random 10.0))
                    (c (random 10.0))
                    (e 1.0))
                (spec "closure"
                     (should-be-a 'float (* a b)))
                (spec "associativity"
                     (should= (* (* a b) c)
                              (* a (* b c))))
                (spec "identity element"
                     (should= a (* e a)))
                (spec "inverse element"
                     (let ((1/a (/ 1 a)))
                       (should= (* 1/a a)
                                (* a 1/a)
                                1.0)))
                (spec "commutitativity"
                     (should= (* a b) (* b a))))))
```

1.1.2   The `spec` Macro

The `spec` macro is used to indicate a specification for a desired be-
havior. It will normally serve as a grouping for assertions or nested
`spec`s.

Syntax

```
(spec description &body body)
```

Arguments and Values

description This is a string to describe the specification.

body This is an implicit proc to contain the specification.

Examples

```
(spec "should pass some tests"
      (should= 12 (foo 3.5))
      (should= 14 (foo 4.22)))
```

1.1.3   The `should` Macro

The `should` macro is the basic building block for most of the behavior
checking. It asserts that `test` returns truthfully for the arguments.

Typically you will want to use one of the macros defined on top of `should` instead of using it directly, such as `should=`.

Syntax

```
(should test &rest arguments)
```

Arguments and Values

test This is the test predicate to evaluate.

arguments These are the arguments to the test predicate.

Examples

```
(should #'= 12 (* 3 4)) ; Passes
(should #'< 4 (* 2 3))  ; Passes
(should #'< 4 5 6 7)    ; Passes
```

1.1.4 The `should-not` Macro

The `should-not` macro is identical to the `should` macro, except that it inverts the result of the call with `not`.

Syntax

```
(should-not test &rest arguments)
```

Arguments and Values

test This is the test predicate to evaluate.

arguments These are the arguments to the test predicate.

Examples

```
(should-not #'< 12 4)  ; Passes
(should-not #'= 12 44) ; Passes
```

1.1.5 The `should-be-null` Macro

The `should-be-null` macro is a short-hand method for `(should #'null ...)`.

Syntax

```
(should-be-null &rest arguments)
```

Arguments and Values

arguments These are the arguments to `null`.

Examples

```
(should-be-null ())          ; Passes
(should-be-null nil)         ; Passes
(should-be-null (not 12))    ; Passes
(should-be-null (and t t nil)) ; Passes
```

1.1.6 The `should-be-true` Macro

The `should-be-true` macro is a short-hand method for `(should #'identity ...)`.

Syntax

```
(should-be-true &rest arguments)
```

Arguments and Values

arguments These are the arguments to `identity`.

Examples

```
(should-be-true t)           ; Passes
(should-be-true (not nil))   ; Passes
(should-be-true (or nil nil 12)) ; Passes
```

1.1.7 The `should-be-false` Macro

The `should-be-false` macro is a short-hand method for `(should #'not ...)`.

Syntax

```
(should-be-false &rest arguments)
```

Arguments and Values

arguments These are the arguments to `not`.

Examples

```
(should-be-false nil)
(should-be-false (not t))
(should-be-false (< 44 2))
```

1.1.8 The `should-be-a` Macro

The `should-be-a` macro specifies that one or more `things` should be of the type specified by `type`.

Syntax

```
(should-be-a type &rest things)
```

Arguments and Values

type This is the type to compare with via `typep`.

things These are the things to confirm the type of.

```
(should-be-a 'integer 1)                ; Passes
(should-be-a 'float 1)                  ; Passes
(should-be-a 'integer 1 2 3 4 5 6 7 8 9) ; Passes
(should-be-a 'integer 1.0)              ; Fails
```

1.1.9 The `should=` Macro

The `should=` macro is a short-hand method for `(should #'= ...)`.

Syntax

```
(should= &rest arguments)
```

Arguments and Values

arguments These are the arguments to =.

Examples

```
(should= 12 12)   ; Passes
(should= 12 12.0) ; Passes
```

1.1.10 The `should-not=` Macro

The `should-not=` macro is a short-hand method for `(should-not #'=
...)`.

Syntax

```
(should-not= &rest arguments)
```

Arguments and Values

arguments These are the arguments to =.

Examples

```
(should-not= 12 12)   ; Fails
(should-not= 12 12.0) ; Fails
(should-not= 12 14)   ; Passes
```

1.1.11   The `should/=` Macro

The `should/=` macro is a short-hand method for `(should #'/= ...)`.

Syntax

```
(should/= &rest arguments)
```

Arguments and Values

arguments These are the arguments to /=.

Examples

```
(should/= 12 13)   ; Passes
(should/= 12 12)   ; Fails
(should/= 12 12.0) ; Fails
```

1.1.12   The `should-not/=` Macro

The `should-not/=` macro is a short-hand method for `(should-not #'/= ...)`.

Syntax

```
(should-not/= &rest arguments)
```

Arguments and Values

arguments These are the arguments to /=.

Examples

```
(should-not/= 12 13)   ; Fails
(should-not/= 12 12)   ; Passes
(should-not/= 12 12.0) ; Passes
```

1.1.13 The `should<` Macro

The `should<` macro is a short-hand method for `(should #'< ...)`.

Syntax

```
(should< &rest arguments)
```

Arguments and Values

arguments These are the arguments to <.

Examples

```
(should< 12 13) ; Passes
(should< 13 12) ; Fails
(should< 12 12) ; Fails
```

1.1.14 The `should-not<` Macro

The `should-not<` macro is a short-hand method for `(should-not #'< ...)`.

Syntax

```
(should-not< &rest arguments)
```

Arguments and Values

arguments These are the arguments to <.

Examples

```
(should-not< 12 13) ; Passes
(should-not< 13 12) ; Fails
(should-not< 12 12) ; Fails
```

1.1.15 The `should>` Macro

The `should<` macro is a short-hand method for `(should #'> ...)`.

Syntax

```
(should> &rest arguments)
```

Arguments and Values

arguments These are the arguments to >.

Examples

```
(should> 12 13) ; Fails
(should> 13 12) ; Passes
(should> 12 12) ; Fails
```

1.1.16 The `should-not>` Macro

The `should-not>` macro is a short-hand method for `(should-not #'> ...)`.

Syntax

```
(should-not> &rest arguments)
```

Arguments and Values

arguments These are the arguments to >.

Examples

```
(should-not> 12 13) ; Passes
(should-not> 13 12) ; Fails
(should-not> 12 12) ; Passes
```

1.1.17 The `should<=` Macro

The `should<=` macro is a short-hand method for `(should #'<= ...)`.

Syntax

```
(should<= &rest arguments)
```

Arguments and Values

arguments These are the arguments to <=.

Examples

```
(should<= 12 13) ; Passes
(should<= 13 12) ; Fails
(should<= 12 12) ; Passes
```

1.1.18 The `should-not<=` Macro

The `should-not<=` macro is a short-hand method for `(should-not #'<= ...)`.

Syntax

```
(should-not<= &rest arguments)
```

Arguments and Values

arguments These are the arguments to `<=`.

Examples

```
(should-not<= 12 13) ; Fails
(should-not<= 13 12) ; Passes
(should-not<= 12 12) ; Fails
```

1.1.19 The `should>=` Macro

The `should>=` macro is a short-hand method for `(should #'>= ...)`.

Syntax

```
(should>= &rest arguments)
```

Arguments and Values

arguments These are the arguments to `>=`.

Examples

```
(should>= 12 13) ; Fails
(should>= 13 12) ; Passes
(should>= 12 12) ; Passes
```

1.1.20 The `should-not>=` Macro

The `should-not>=` macro is a short-hand method for `(should-not #'>= ...)`.

Syntax

```
(should-not>= &rest arguments)
```

Arguments and Values

arguments These are the arguments to >=.

Examples

```
(should-not>= 12 13) ; Passes
(should-not>= 13 12) ; Fails
(should-not>= 12 12) ; Fails
```

1.1.21 The `should-eq` Macro

The `should-eq` macro is a short-hand method for `(should #'eq ...)`.

Syntax

```
(should-eq &rest arguments)
```

Arguments and Values

arguments These are the arguments to `eq`.

Examples

```
(should-eq 12 12)      ; Probably passes
(should-eq 13 12)      ; Fails
(should-eq "foo" "foo") ; May pass, may fail.
```

1.1.22 The `should-not-eq` Macro

The `should-not-eq` macro is a short-hand method for `(should-not #'eq ...)`.

Syntax

```
(should-not-eq &rest arguments)
```

Arguments and Values

arguments These are the arguments to `eq`.

Examples

```
(should-not-eq 12 12)     ; Probably fails
(should-not-eq 13 12)     ; Passes
(should-not-eq "foo" "foo") ; May pass, may fail.
```

1.1.23 The `should-eql` Macro

The `should-eql` macro is a short-hand method for `(should #'eql ...)`.

Syntax

```
(should-eql &rest arguments)
```

Arguments and Values

arguments These are the arguments to `eql`.

Examples

```
(should-eql 12 12)     ; Passes
(should-eql 13 12)     ; Fails
(should-eql "foo" "foo") ; May pass, may fail.
```

1.1.24 The `should-not-eql` Macro

The `should-not-eql` macro is a short-hand method for `(should-not #'eql ...)`.

Syntax

```
(should-not-eql &rest arguments)
```

Arguments and Values

arguments These are the arguments to `eql`.

Examples

```
(should-not-eql 12 12)     ; Fails
(should-not-eql 13 12)     ; Passes
(should-not-eql "foo" "foo") ; May pass, may fail.
```

1.1.25 The `should-equal` Macro

The `should-equal` macro is a short-hand method for `(should #'equal ...)`.

Syntax

```
(should-equal &rest arguments)
```

Arguments and Values

arguments These are the arguments to `equal`.

Examples

```
(should-equal 12 12)      ; Passes
(should-equal 13 12)      ; Fails
(should-equal "foo" "foo") ; Passes
(should-equal "FOO" "foo") ; Fails
```

1.1.26   The `should-not-equal` Macro

The `should-not-equal` macro is a short-hand method for `(should-not #'equal ...)`.

Syntax

```
(should-not-equal &rest arguments)
```

Arguments and Values

arguments These are the arguments to `equal`.

Examples

```
(should-not-equal 12 12)      ; Passes
(should-not-equal 13 12)      ; Fails
(should-not-equal "foo" "foo") ; Fails
(should-not-equal "FOO" "foo") ; Passes
```

1.1.27   The `should-equalp` Macro

The `should-equalp` macro is a short-hand method for `(should #'equalp ...)`.

Syntax

```
(should-equalp &rest arguments)
```

Arguments and Values

arguments These are the arguments to `equalp`.

Examples

```
(should-equalp 12 12)       ; Passes
(should-equalp 13 12)       ; Fails
(should-equalp "foo" "foo") ; Passes
(should-equalp "FOO" "foo") ; Passes
```

1.1.28 The `should-not-equalp` Macro

The `should-not-equalp` macro is a short-hand method for `(should-not #'equalp ...)`.

Syntax

```
(should-not-equalp &rest arguments)
```

Arguments and Values

arguments These are the arguments to `equalp`.

Examples

```
(should-not-equalp 12 12)       ; Passes
(should-not-equalp 13 12)       ; Fails
(should-not-equalp "foo" "foo") ; Passes
(should-not-equalp "FOO" "foo") ; Fails
```

1.1.29 The `should-string=` Macro

The `should-string=` macro is a short-hand method for `(should #'string= ...)`.

Syntax

```
(should-string= &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string=`.

Examples

```
(should-string= "foo" "foo") ; Passes
(should-string= "FOO" "foo") ; Fails
```

1.1.30 The `should-not-string=` Macro

The `should-not-string=` macro is a short-hand method for `(should-not #'string= ...)`.

Syntax

```
(should-not-string= &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string=`.

Examples

```
(should-not-string= "foo" "foo") ; Fails
(should-not-string= "FOO" "foo") ; Passes
```

1.1.31 The `should-string/=` Macro

The `should-string/=` macro is a short-hand method for `(should #'string/= ...)`.

Syntax

```
(should-string/= &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string/=`.

Examples

```
(should-string/= "foo" "foo") ; Fails
(should-string/= "FOO" "foo") ; Passes
```

1.1.32 The `should-not-string/=` Macro

The `should-not-string/=` macro is a short-hand method for `(should-not #'string/= ...)`.

Syntax

```
(should-not-string/= &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string/=`.

Examples

```
(should-not-string/= "foo" "foo") ; Passes
(should-not-string/= "FOO" "foo") ; Fails
```

1.1.33 The `should-string<` Macro

The `should-string<` macro is a short-hand method for `(should #'string<`
`...)`.

Syntax

```
(should-string< &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string<`.

Examples

```
(should-string< "foo" "f")      ; Fails
(should-string< "foo" "foo")    ; Fails
(should-string< "foo" "FOOBAR") ; Fails
(should-string< "foo" "foobar") ; Passes
```

1.1.34 The `should-not-string<` Macro

The `should-not-string<` macro is a short-hand method for `(should-not`
`#'string< ...)`.

Syntax

```
(should-not-string< &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string<`.

Examples

```
(should-not-string< "foo" "f")      ; Passes
(should-not-string< "foo" "foo")    ; Passes
(should-not-string< "foo" "foobar") ; Fails
```

1.1.35 The `should-string>` Macro

The `should-string>` macro is a short-hand method for `(should #'string>`
`...)`.

Syntax

```
(should-string> &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string>`.

Examples

```
(should-string> "foo" "f")      ; Passes
(should-string> "foo" "foo")    ; Fails
(should-string> "foo" "FOO")    ; Passes
(should-string> "foo" "foobar") ; Fails
```

1.1.36 The `should-not-string>` Macro

The `should-not-string>` macro is a short-hand method for `(should-not #'string> ...)`.

Syntax

```
(should-not-string> &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string>`.

Examples

```
(should-not-string> "foo" "f")      ; Fails
(should-not-string> "foo" "foo")    ; Passes
(should-not-string> "foo" "foobar") ; Passes
```

1.1.37 The `should-string<=` Macro

The `should-string<=` macro is a short-hand method for `(should #'string<= ...)`.

Syntax

```
(should-string<= &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string<=`.

Examples

```
(should-string<= "foo" "f")      ; Fails
(should-string<= "foo" "foo")    ; Passes
(should-string<= "foo" "foobar") ; Passes
```

1.1.38 The `should-not-string<=` Macro

The `should-not-string<=` macro is a short-hand method for `(should-not #'string<= ...)`.

Syntax

```
(should-not-string<= &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string<=`.

Examples

```
(should-not-string<= "foo" "f")      ; Passes
(should-not-string<= "foo" "foo")    ; Fails
(should-not-string<= "foo" "foobar") ; Fails
```

1.1.39 The `should-string>=` Macro

The `should-string>=` macro is a short-hand method for `(should #'string>= ...)`.

Syntax

```
(should-string>= &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string>=`.

Examples

```
(should-string>= "foo" "f")      ; Passes
(should-string>= "foo" "foo")    ; Passes
(should-string>= "foo" "foobar") ; Fails
```

1.1.40 The `should-not-string>=` Macro

The `should-not-string>=` macro is a short-hand method for `(should-not #'string>= ...)`.

Syntax

```
(should-not-string>= &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string>=`.

Examples

```
(should-not-string>= "foo" "f")      ; Fails
(should-not-string>= "foo" "foo")    ; Fails
(should-not-string>= "foo" "foobar") ; Passes
```

1.1.41   The `should-string-equal` Macro

The `should-string-equal` macro is a short-hand method for `(should
#'string-equal ...)`.

Syntax

```
(should-string-equal &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string-equal`.

Examples

```
(should-string-equal "foo" "foo")    ; Passes
(should-string-equal "FOO" "foo")    ; Passes
(should-string-equal "foo" "foobar") ; Fails
```

1.1.42   The `should-not-string-equal` Macro

The `should-not-string-equal` macro is a short-hand method for `(should-not
#'string-equal ...)`.

Syntax

```
(should-not-string-equal &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string-equal`.

Examples

```
(should-not-string-equal "foo" "foo")   ; Fails
(should-not-string-equal "FOO" "foo")   ; Fails
(should-not-string-equal "foo" "foobar") ; Passes
```

1.1.43 The `should-string-not-equal` Macro

The `should-string-not-equal` macro is a short-hand method for `(should #'string-not-equal ...)`.

Syntax

```
(should-string-not-equal &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string-not-equal`.

Examples

```
(should-string-not-equal "foo" "foo")   ; Fails
(should-string-not-equal "FOO" "foo")   ; Fails
(should-string-not-equal "foo" "foobar") ; Passes
```

1.1.44 The `should-not-string-not-equal` Macro

The `should-not-string-not-equal` macro is a short-hand method for `(should-not #'string-not-equal ...)`.

Syntax

```
(should-not-string-not-equal &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string-not-equal`.

Examples

```
(should-not-string-not-equal "foo" "foo")   ; Passes
(should-not-string-not-equal "FOO" "foo")   ; Passes
(should-not-string-not-equal "foo" "foobar") ; Fails
```

1.1.45 The `should-string-lessp` Macro

The `should-string-lessp` macro is a short-hand method for `(should #'string-lessp ...)`.

Syntax

```
(should-string-lessp &rest arguments)
```

Arguments and Values

arguments These are the arguments to string-lessp.

Examples

```
(should-string-lessp "foo" "f")      ; Fails
(should-string-lessp "foo" "foo")    ; Fails
(should-string-lessp "foo" "FOOBAR") ; Passes
(should-string-lessp "foo" "foobar") ; Passes
```

1.1.46 The `should-not-string-lessp` Macro

The should-not-string-lessp macro is a short-hand method for (should-not #'string-lessp ...).

Syntax

```
(should-not-string-lessp &rest arguments)
```

Arguments and Values

arguments These are the arguments to string-lessp.

Examples

```
(should-not-string-lessp "foo" "f")      ; Passes
(should-not-string-lessp "foo" "foo")    ; Passes
(should-not-string-lessp "foo" "FOOBAR") ; Fails
(should-not-string-lessp "foo" "foobar") ; Fails
```

1.1.47 The `should-string-greaterp` Macro

The should-string-greaterp macro is a short-hand method for (should #'string-greaterp ...).

Syntax

```
(should-string-greaterp &rest arguments)
```

Arguments and Values

arguments These are the arguments to string-greaterp.

Examples

```
(should-string-greaterp "foo" "f")      ; Passes
(should-string-greaterp "foo" "foo")    ; Fails
(should-string-greaterp "foo" "FOO")    ; Fails
(should-string-greaterp "foo" "foobar") ; Fails
```

1.1.48 The `should-not-string-greaterp` Macro

The `should-not-string-greaterp` macro is a short-hand method for `(should-not #'string-greaterp ...)`.

Syntax

```
(should-not-string-greaterp &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string-greaterp`.

Examples

```
(should-not-string-greaterp "foo" "f")      ; Fails
(should-not-string-greaterp "foo" "foo")    ; Passes
(should-not-string-greaterp "foo" "FOO")    ; Passes
(should-not-string-greaterp "foo" "foobar") ; Passes
```

1.1.49 The `should-string-not-greaterp` Macro

The `should-string-not-greaterp` macro is a short-hand method for `(should #'string-not-greaterp ...)`.

Syntax

```
(should-string-not-greaterp &rest arguments)
```

Arguments and Values

arguments These are the arguments to `string-not-greaterp`.

Examples

```
(should-string-not-greaterp "foo" "f")      ; Fails
(should-string-not-greaterp "foo" "foo")    ; Passes
(should-string-not-greaterp "foo" "FOO")    ; Passes
(should-string-not-greaterp "foo" "foobar") ; Passes
```

1.1.50 The `should-not-string-not-greaterp` Macro

The `should-not-string-not-greaterp` macro is a short-hand method
for `(should-not #'string-not-greaterp ...)`.

Syntax

`(should-not-string-not-greaterp &rest arguments)`

Arguments and Values

arguments These are the arguments to `string-not-greaterp`.

Examples

```
(should-not-string-not-greaterp "foo" "f")       ; Passes
(should-not-string-not-greaterp "foo" "foo")     ; Fails
(should-not-string-not-greaterp "foo" "FOO")     ; Fails
(should-not-string-not-greaterp "foo" "foobar")  ; Fails
```

1.1.51 The `should-string-not-lessp` Macro

The `should-string-not-lessp` macro is a short-hand method for `(should
#'string-not-lessp ...)`.

Syntax

`(should-string-not-lessp &rest arguments)`

Arguments and Values

arguments These are the arguments to `string-not-lessp`.

Examples

```
(should-string-not-lessp "foo" "f")       ; Passes
(should-string-not-lessp "foo" "foo")     ; Passes
(should-string-not-lessp "foo" "FOOBAR")  ; Fails
(should-string-not-lessp "foo" "foobar")  ; Fails
```

1.1.52 The `should-not-string-not-lessp` Macro

The `should-not-string-not-lessp` macro is a short-hand method
for `(should-not #'string-not-lessp ...)`.

Syntax

`(should-not-string-not-lessp &rest arguments)`

Arguments and Values

arguments These are the arguments to `string-not-lessp`.

Examples

```
(should-not-string-not-lessp "foo" "f")      ; Fails
(should-not-string-not-lessp "foo" "foo")    ; Fails
(should-not-string-not-lessp "foo" "FOOBAR") ; Passes
(should-not-string-not-lessp "foo" "foobar") ; Passes
```

Chapter 2

The `sigma/control` Package

The `sigma/control` package contains code for basic program control systems. These are mostly basic macros to add more complicated looping, conditionals, or similar. These are typically extensions to Common Lisp that are inspired by other programming languages. Thanks to the power of Common Lisp and its macro system, we can typically implement most features of any other language with little trouble.

2.1 Macros

2.1.1 The `aif` Macro

The `aif` macro is an anaphoric variation of the built-in `if` control structure. This is based on [1, p. 190]. The basic idea is to provide an anaphor (such as pronouns in English) for the conditional so that it can easily be referred to within the body of the conditional expression. The most natural pronoun in the English language for a thing is "it", so that is what is used. If you need or want to use a different anaphor, use `a?if`. The most common use of `aif` is for when you want to do some additional computation with some time-consuming calculation, but only if it returned successfully.

Syntax

```
(aif conditional t-action &optional nil-action)
```

Arguments and Values

conditional The boolean conditional to select between the *t-action* and the *nil-action*.

t-action The action to evaluate if the *conditional* evaluate as true.

nil-action The action to evaluate if the *conditional* evaluates as nil.

Examples

```
(aif (big-long-calculation)
     (foo it)
     (format t "The big-long-calculation failed!~%"))
```

This is similar to the following, but with less typing:

```
(let ((it (big-long-calculation)))
  (if it
      (foo it)
\       (format t "The big-long-calculation failed!~%")))
```

Or say you need to get a user name from a database call, which might be slow.

```
(aif (get-user-name)
     (format -t "Hello, ~A!~%" it)
     (format -t "You aren't logged in, go away!~%"))
```

2.1.2   The `a?if` Macro

The `a?if` macro is a variation of `aif` that allows for the specification of the anaphor to use, instead of being restricted to just `it`, the default with `aif`. This is most often useful when you need to nest calls to anaphoric macros.

Syntax

```
(a?if anaphor conditional t-action &optional nil-action)
```

Arguments and Values

anaphor The result of the *conditional* will be stored in the variable specified as the anaphor.

conditional The boolean conditional to select between the *t-action* and the *nil-action*.

t-action The action to evaluate if the *conditional* evaluate as true.

nil-action The action to evaluate if the *conditional* evaluates as nil.

Examples

```
(a?if foo 'outer
  (a?if bar 'inner
    `(,foo ,bar))) ; Returns '(outer inner)
```

2.1.3 The `aand` Macro

The `aand` macro is an anaphoric variation of the built-in `and`. This is based on [1, p. 191]. It works in a similar manner to `aif`, defining `it` as the current argument for use in the next argument, reassigning `it` with each argument.

Syntax

```
(aand &rest arguments)
```

Examples

```
(aand 2         ; Sets 'it' to 2.
     (* 3 it)  ; Sets 'it' to 6.
     (* 4 it)) ; Returns 24.
```

2.1.4 The `a?and` Macro

The `a?and` macro is a variant of `aand` that allows for the specification of the anaphor to use, instead of being restricted to just `it`, the default with `aand`. This is most often useful when you need to nest calls to anaphoric macros.

Examples

```
(a?and foo 12 (* 2 foo) (* 3 foo)) ; Returns 72.

(a?and foo 1 2 3 'outer
  (a?and bar 4 5 6 'inner `(,foo ,bar))) ; Returns '(outer inner)
```

2.1.5 The `alambda` Macro

The `alambda` macro is an anaphoric variant of the built-in `lambda`. This is based on [1, p. 193]. It works in a similar manner to `aif` and `aand`, except it defines `self` instead of `it` as the default anaphor. This is useful so that you can write recursive lambdas.

```
(funcall (alambda (x) ; Simple recursive factorial example.
           (if (<= x 0)
               1
               (* x (self (1- x)))))
       10))) ; Calculates 10!, inefficently.
```

2.1.6   The `a?lambda` Macro

The `a?lambda` macro is an variant of `alambda` that allows you to specify the anaphor to use, instead of just the default of `it`.

```
(funcall (a?lambda ! (x) ; Simple recursive factorial example.
           (if (<= x 0)
               1
               (* x (! (1- x)))))
        10))) ; Calculates 10!, inefficently.
```

2.1.7   The `ablock` Macro

The `ablock` macro is an anaphoric variant of the built-in `block`. This is based on [1, p. 193]. It works in a similar manner to `aand`, defining the anaphor `it` for each argument to the block.

Examples

```
(let (w x y z)
   (ablock b
           (setf w 7)
           (setf x (* 2 it)) ; Twice w, 14.
           (setf y (* 3 it)) ; Thrice x, 42.
           (return-from b)   ; Leave the block.
           (setf z 123))     ; Never happens.
   (list w x y z))           ; Returns '(7 14 42 nil)
```

2.1.8   The `a?block` Macro

The `a?block` macro is an anaphoric variant of `ablock` that allows you to specify the anaphor to use, instead of just the default of `it`.

Examples

```
(let (w x y z)
   (a?block b foo
           (setf w 7)
           (setf x (* 2 foo)) ; Twice w, 14.
           (setf y (* 3 foo)) ; Thrice x, 42.
           (return-from b)    ; Leave the block.
           (setf z 123))      ; Never happens.
   (list w x y z))            ; Returns '(7 14 42 nil)
```

2.1.9   The `acond` Macro

The `acond` macro is an anaphoric variant of the built-in `cond`. This is based on [1, p. 191]. It works in a similar manner to `aand`, defining the anaphor `it` for each argument to the conditional.

Examples

```
(let (a b (c 3))
  (acond (a it)          ; No.
         (b it)          ; No.
         (c (* 4 it))))) ; Yes, returns 12 = 4*3, the value of c.
```

2.1.10 The `a?cond` Macro

The `a?cond` macro is an anaphoric variant of `acond` that allows you to specify the anaphor to use, instead of just the default of `it`.

Examples

```
(let (a b (c 3))
  (a?cond foo
          (a foo)          ; No.
          (b foo)          ; No.
          (c (* 4 foo))))) ; Yes, returns 12 = 4*3, the value of c.
```

2.1.11 The `awhen` Macro

The `awhen` macro is an anaphoric variant of `when` built-in. This is based on [1, p. 191]. It works in a similar manner to `aif`, defining `it` as the default anaphor. This is useful when the conditional is the result of a complicated computation, so you don't have to compute it twice or wrap the computation in a let block yourself.

Syntax

```
(awhen conditional &body body)
```

Examples

```
(awhen (get-user-name)
  (do-something-with-name it)
  (do-more-stuff)
  (format -t "Hello, ~A!~%" it))
```

2.1.12 The `a?when` Macro

The `a?when` macro is similar to the `awhen`, except that it allows you to specify the anaphor to use, instead of just the default of `it`.

Syntax

```
(a?when conditional &body body)
```

Examples

```
(a?when user (get-user-name)
  (do-something-with-name user)
  (do-more-stuff)
  (format -t "Hello,␣~A!~%" user))
```

2.1.13 The `awhile` Macro

The `awhile` macro is an anaphoric variant of `while`. This is based
on [1, p. 191]. This is useful if you need to consume input repeatedly
for all input.

Syntax

```
(awhile expression &body body)
```

Examples

```
(awhile (get-input)
  (do-something it)) ; Operate on input for all input.
```

2.1.14 The `a?while` Macro

The `a?while` macro is a variant of `awhile` that allows you to specify
the anaphor to use, instead of just the default `it`.

Syntax

```
(awhile anaphor expression &body body)
```

Examples

```
(awhile input (get-input)
  (do-something input)) ; Operate on input for all input.
```

2.1.15 The `deletef` Macro

The `deletef` macro deletes `item` from `sequence` in-place.

Syntax

```
(deletef item sequence &rest rest)
```

Examples

```
(let ((men '(good bad ugly)))
  (deletef 'bad men)
  (deletef 'ugly men)
  men) ; Only the good is left.
```

2.1.16 The `do-while` Macro

The `do-while` macro operates like a `do {BODY} while (CONDITIONAL)` in the C programming language.

Syntax

```
(do-while conditional &body body)
```

Examples

```
(let ((t-minus 10))
  (do-while (<= 0 t-minus)
    (format t "~A␣...␣" t-minus)
    (decf t-minus)))
(format t "Liftoff!~%")
```

2.1.17 The `do-until` Macro

The `do-until` macro operates like a `do {body} while (!  conditional)` in the C programming language.

Syntax

```
(do-until conditional &body body)
```

Examples

```
(let ((t-minus 10))
  (do-until (< t-minus 0)
    (format t "~A␣...␣" t-minus)
    (decf t-minus)))
(format t "Liftoff!~%")
```

2.1.18 The `fop` Macro

`fop` is like the `opf` macro, but as a post-assignment variant. The difference is similar to the difference between `x++` and `++x` in the C Programming Language, with opf being like `++x` and fop being like `x++`.

Syntax

```
(fop operator variable &rest arguments)
```

Examples

```
(let ((x 10))
  (while (<= 0 x)
    (format t "~A␣...␣" (fop #'- x 1))))
(format t "Liftoff!~%")
```

2.1.19 The `for` Macro

A `for` macro, much like the `for` in the C programming language.

Syntax

```
(for initial conditional step-action &body body)
```

Examples

```
(for ((i 0))
     (< i 10)
     (incf i)
  (format t \"~%~A\"␣i))
```

2.1.20 The `forever` Macro

The `forever` macro is just a way to say `(while t ...)` with a bit of added expressiveness and explicitness.

Examples

```
(forever (let ((in (read)))
           (if (eq in 'quit))
               (format t "I␣can't␣let␣you␣do␣that,␣Dave.")
               (format t "You␣entered␣~A" in)))
```

2.1.21 The `multicond` Macro

The `multicond` macro is much like `cond`, but where multiple clauses may be evaluated.

Examples

```
(let ((x 12))
  (multicond ((= x 12) ; This will evaluate.
              (format t "X␣is␣12!␣␣My␣favorite␣number!~%"))
             ((< x 100) ; This will evaluate also.
              (format t "X␣is␣small.~%"))
             ((< x 0) ; But this one won't.
              (format t "X␣is␣negative.~%"))))
```

2.1.22 The `opf` Macro

The `opf` macro is a generic operate-and-store, along the lines of `incf` and `decf`, but allowing for any operation.

Syntax

```
(opf operator variable &rest arguments)
```

Examples

```
;;; Prints 1 ... 2 ... 4 ... 8 ... ⋯ ... 65535 ... that's it!
(let ((x 1))
  (while (<= x (expt 2 16))
    (format t "~A␣...␣" x)
    (opf #'* x 2)))
(format t "␣that's␣it!~%")
```

2.1.23 The `swap` Macro

This is a simple `swap` macro. The values of the first and second form are swapped with each other.

Syntax

```
(swap x y)
```

Examples

```
(let ((first "the␣first")
      (last "the␣last"))
  (swap first last)
  `(,first ,last)) ; Returns '("the last" "the first")
```

2.1.24 The `swap-unless` Macro

This macro calls `swap` unless the predicate evaluates to true.

Syntax

```
(swap-unless predicate x y)
```

Examples

```
;;; make smaller and larger in the correct order.
(let ((smaller 12)
      (larger 266))
  (swap-unless #'<= smaller larger))
```

2.1.25 The swap-when Macro

This macro calls swap when the predicate evaluates to true.

Syntax

```
(swap-when predicate x y)
```

Examples

```
;;; make smaller and larger in the correct order.
(let ((smaller 12)
      (larger 6))
  (swap-when #'> smaller larger))
```

2.1.26 The until Macro

The until macro is similar to the while loop in C, but with a negated
conditional.

Syntax

```
(until conditional &body body)
```

Examples

```
(let ((x 10))
  (until (< x 0)
    (format t "˜A␣...␣" x)
    (decf x))
  (format t "Liftoff!˜%"))
```

2.1.27 The while Macro

This while macro is similar to the while loop in C.

Syntax

```
(while conditional &body body)
```

Examples

```
(let ((x 10))
  (while (<= 0 x)
    (format t "˜A␣...␣" x)
    (decf x))
  (format t "Liftoff!˜%"))
```

2.2   Functions

2.2.1   The `compose` Function

The `compose` function composes a single function from a list of several functions such that the new function is equivalent to calling the functions in succession. This is based upon a `compose` function in [2], which is based upon the `compose` function from Dylan.

Syntax

```
(compose &rest functions)
```

Examples

```
(funcall (compose #'sin #'cos #'tan) pi) ; Returns about 0.8414709848078965.
(sin (cos (tan pi))) ; This is the same.
```

2.2.2   The `conjoin` Function

The `conjoin` function takes in one or more predicates, and returns a predicate that returns true whenever all of the predicates return true. This is from [2] and is based upon the `conjoin` function from Dylan.

Syntax

```
(conjoin predicate &rest predicates)
```

Examples

```
;;; Returns '(6 12 18 24 30 36 42 48 54 60 66 72 78 84 90 96).
(remove-if-not #'identity
  (flet ((mod-2? (i) (zerop (mod i 2)))
         (mod-3? (i) (zerop (mod i 3))))
    (loop for i from 1 to 100 collect
          (when (funcall (conjoin #'mod-2? #'mod-3?) i)
                i))))
```

2.2.3 The `curry` Function

The `curry` function takes in a function and some of its arguments, and returns a function that expects the rest of the required arguments. This is from [2] and is based upon the `curry` function from Dylan.

Syntax

```
(curry function &rest arguments)
```

Examples

```
(let ((x 123)
      (f (curry #'+ x)))
  (loop for i from 1 to 10 collect
        (funcall f i)))
```

2.2.4 The `disjoin` Function

The `disjoin` function takes in one or more predicates, and returns a predicate that returns true whenever any of the predicates return true. This is from [2] and is based upon the disjoin function from Dylan.

Syntax

```
(disjoin predicate &rest predicates)
```

Examples

```
;;; Returns  '(#\1 #\2 #\3 #\a #\b #\c NIL      NIL)
(let ((chars '(#\1 #\2 #\3 #\a #\b #\c #\Space #\Newline)))
  (mapcar (lambda (c)
            (when (funcall (disjoin #'alpha-char-p #'digit-char-p)
                           c)
              c))
          chars))
```

2.2.5 The `function-alias` Function

The `function-alias` function produces one or more aliases (alternate names) for a function.

Syntax

```
(function-alias function &rest aliases)
```

Examples

```
(function-alias 'that-guy-doesnt-know-when-to-stop-typing 'shorter)
```

2.2.6 The `operator-to-function` Function

The `operator-to-function` function takes in any symbol and makes an evaluatable function out of it. The principle purpose for this is so that we can treat macros and other non-function things like a function, for using them with `mapcar` or similar.

Known Issues

[Issue #8]

Syntax

```
(operator-to-function operator)
```

Examples

```
;;; In case you don't like (setf a 1 b 2 c 3).
(mapcar (operator-to-function 'setf)
        '(a b c)
        '(1 2 3))
```

2.2.7 The `rcompose` Function

The `rcompose` function is a reversed variant of the `compose` function.

Syntax

```
(compose &rest functions)
```

Examples

```
(funcall (rcompose #'sin #'cos #'tan) pi) ; Returns about 1.5574077246549023.
(tan (cos (sin pi))) ; This is the same.
```

2.2.8 The `rcurry` Function

<p align="center" style="color:red">...TO DO...</p>

2.2.9 The `unimplemented` Function

<p align="center" style="color:red">...TO DO...</p>

2.3   Generics

2.3.1   The `duplicate` Generic

<center>. . . TO DO . . .</center>

Chapter 3

The `sigma/hash` Package

3.1 Macros

3.1.1 The `sethash` Macro

The `sethash` macro is shortcut for `setf gethash`.

3.2 Functions

3.2.1 The `populate-hash-table` Function

The `populate-hash-table` function makes initial construction of hash tables a lot easier, just taking in key/value pairs as the arguments to the function, and returning a newly-constructed hash table.

Examples

```
(populate-hash-table 'name "Valentinus"
                     'likes '(birds roses)
                     'dislikes '(beheadings epilepsy "false idols")
                     'died 269)
```

3.2.2 The `inchash` Function

The `inchash` function will increment the value in *key* of the *hash*, initializing it to 1 if it isn't currently defined.

3.2.3 The `dechash` Function

The `dechash` function will decrement the value in *key* of the *hash*, initializing it to −1 if it isn't currently defined.

3.2.4 The `gethash-in` Function

The `gethash-in` function works like `gethash`, but allows for multiple keys to be specified at once, to work with nested hash tables.

Syntax

(gethash-in *keys hash-table* &optional *default*)

Arguments and Values

keys A list of objects.

hash-table A hash table.

default An object. The default is nil.

Returns

value An object.

present? A generalized boolean.

Examples

```
(let ((h (make-hash-table)))
  (sethash 'a h 12)
  (gethash-in '(a) h)) ; Returns 12

(let ((h (make-hash-table))
      (i (make-hash-table)))
  (sethash 'b i 123)
  (sethash 'a h i)
  (gethash-in '(a b) h 123)) ; Returns 123
```

Chapter 4

The `sigma/numeric` Package

4.1 Macros

4.1.1 The `+f` Macro

The `+f` macro is an alias for `incf`.

4.1.2 The `-f` Macro

The `-f` macro is an alias for `decf`.

4.1.3 The `*f` Macro

The `*f` macro is an alias for `multf`.

4.1.4 The `/f` Macro

The `/f` macro is an alias for `divf`.

4.1.5 The `divf` Macro

The `divf` macro is divide-and-store, along the lines of `incf` and `decf`, but with division instead. This is similar to `x` `/= something` in the C programming language.

Syntax

```
(divf variable &rest arguments)
```

Examples

```
;;; Prints 65536 ... ⋯ 8 ... 4 ... 2 ... 1 ... 0 ... that's it!
(let ((x (expt 2 16)))
  (while (<= 0 x)
    (format t "~A␣...␣" x)
    (divf x 2)))
(format t "␣that's␣it!~%")
```

4.1.6 The `f+` Macro

The `f+` macro is similar to `incf` or `+f`, but it is a post-increment instead of a pre-increment. That is, `f+` works like `x++` in C but `incf` and `+f` work like `++x` in C.

Syntax

```
(f+ variable &rest addends)
```

Examples

```
(let ((x 12))
  (list x (f+ x) x)) ; Returns '(12 12 13).
```

4.1.7 The `f-` Macro

The `f-` macro is similar to `decf` or `-f`, but it is a post-decrement instead of a pre-decrement. That is, `f-` works like `x--` in C but `decf` and `-f` work like `--x` in C.

Syntax

```
(f- variable &rest subtrahends)
```

Examples

```
(let ((x 12))
  (list x (f- x) x)) ; Returns '(12 12 11).
```

4.1.8 The `f*` Macro

The `f*` macro is similar to `multf` or `*f`, but it is a post-multiply instead of a pre-multiply. That is, `f*` works like `x++` in C (just for multiplication instead of addition) but `multf` and `*f` work like `++x` in C (again, just for multiplication instead of addition.)

Syntax

```
(f* variable &rest multiplicands)
```

Examples

```
(let ((x 12))
  (list x (f* x 2) x)) ; Returns '(12 12 24).
```

4.1.9 The `f/` Macro

The `f/` macro is similar to `divf` or `/f`, but it is a post-divide instead of a pre-divide. That is, `f/` works like `x++` in C (just for division instead of addition) but `divf` and `/f` work like `++x` in C (again, just for division instead of addition.)

Syntax

```
(f/ variable &rest divisors)
```

Examples

```
(let ((x 12))
  (list x (f/ x 2) x)) ; Returns '(12 12 6).
```

4.1.10 The `multf` Macro

The `divf` macro is multiply-and-store, along the lines of `incf` and `decf`, but with multiplication instead. This is similar to `x *= something` in the C programming language.

Syntax

```
(multf variable &rest arguments)
```

Examples

```
;;; Prints 1 ... 2 ... 4 ... 8 ... ⋯ ... 65535 ... that's it!
(let ((x 1))
  (while (<= x (expt 2 16))
    (format t "~A␣...␣" x)
    (multf x 2)))
(format t "␣that's␣it!~%")
```

4.2 Functions

4.2.1 The `bit?` Function

<div align="center">. . . TO DO . . .</div>

4.2.2 The `choose` Function

The `choose` function computes the binomial coefficient for n and k, typically spoken as *n choose k*, and usually written mathematically as $\binom{n}{k}$.

4.2.3 The `factorial` Function

The `factorial` function computes $n!$ for positive integers. NB, this isn't intelligent, and uses a loop instead of better approaches.

4.2.4 The `fractional-part` Function

... TO DO ...

4.2.5 The `fractional-value` Function

... TO DO ...

4.2.6 The `integer-range` Function

... TO DO ...

4.2.7 The `nonnegative?` Function

... TO DO ...

4.2.8 The `nonnegative-integer?` Function

... TO DO ...

4.2.9 The `positive-integer?` Function

8.2.2 The `nth-from-end` Function

...TO DO ...

8.2.3 The `sequence?` Function

. . . TO DO . . .

8.2.4 The `empty-sequence?` Function

. . . TO DO . . .

8.2.5 The `join-symbol-to-all-following` Function

This function takes a symbol and a list, and for every occurance of the symbol in the list, it joins it to the item following it. For example:

Syntax

```
(join-symbol-to-all-following symbol list)
```

Examples

```
(join-symbol-to-all-following :# '(:# 10 :# 20 :# 30))
;; Returns '(:#10 :#20 :#30)
```

Affected By

```
*print-escape*, *print-radix*, *print-base*, *print-circle*,
*print-pretty*, *print-level*, *print-length*, *print-case*,
*print-gensym*, *print-array*.
```

8.2.6 The `join-symbol-to-all-preceeding` Function

This function takes a symbol and a list, and for every occurance of the symbol in the list, it joins it to the item preceeding it. For example:

Syntax

```
(join-symbol-to-all-preceeding symbol list)
```

Examples

```
(join-symbol-to-all-preceeding :% '(10 :% 20 :% 30 :%))
;; Returns '(:10% :20% :30%)
```

Affected By

```
*print-escape*, *print-radix*, *print-base*, *print-circle*,
*print-pretty*, *print-level*, *print-length*, *print-case*,
*print-gensym*, *print-array*.
```

8.2.7 The `list-to-vector` Function

<center>. . . TO DO . . .</center>

8.2.8 The `max*` Function

The `max*` function is a shortcut for `max`. It takes in one or more lists and finds the maximum value within all of them. This is so you don't have to manually use `apply` and `concatenate`.

Syntax

```
(min &rest lists)
```

Examples

```
(max* '(1 2 3 100 4 5)) ; Returns 100
(max* '(1 2 3 4)
      '(5 6 99 7)
      '(8 9 10)) ; Returns 99
```

8.2.9 The `min*` Function

The `min*` function is a shortcut for `min`. It takes in one or more lists and finds the maximum value within all of them. This is so you don't have to manually use `apply` and `concatenate`.

Syntax

```
(min &rest lists)
```

Examples

```
(min* '(1 2 3 -100 4 5)) ; Returns -100
(min* '(1 2 3 4)
      '(5 6 -99 7)
      '(8 9 10)) ; Returns -99
```

<div align="center">. . . TO DO . . .</div>

Chapter 9

The `sigma/string` Package

The `String` package contains useful tools for working with strings.

9.1 Functions

9.1.1 The `character-range` Function

The `character-range` function returns a list of characters from the *start* to the *end* character. Note that this is returning a list, not a string.

Syntax

(character-range *start end*) $\Longrightarrow$ '(*start ... end*)

Arguments and Values

start The character to start the range with, inclusive.

end The character to end the range with, inclusive.

Examples

```
(character-range #\a #\e) ⟹ '(#\a #\b #\c #\d #\e)
(character-range #\e #\a) ⟹ '(#\a #\b #\c #\d #\e)
```

9.1.2 The `character-ranges` Function

The `character-ranges` function is a convenience wrapper for `character-range` function, concatenating several calls and making the resultant list contain only unique instances.

Syntax

```
(character-ranges start₁ end₁ ... ⟹ '(character₁ ...)
```

Arguments and Values

start$_n$ The character to start the nth range with, inclusive.

end$_n$ The character to end the nth range with, inclusive.

Examples

```
(character-ranges #\a #\c #\x #\z) ⟹ '(#\a #\b #\c #\x #\y
#\z)
(character-ranges #\a #\c #\a #\c) ⟹ '(#\a #\b #\c)
```

9.1.3 The `escape-tildes` Function

... TO DO ...

9.1.4 The `replace-char` Function

... TO DO ...

9.1.5 The `strcat` Function

... TO DO ...

9.1.6 The `strmult` Function

... TO DO ...

9.1.7 The `string-join` Function

... TO DO ...

9.1.8 The `stringify` Function

... TO DO ...

9.1.9 The `to-string` Function

<div align="center">. . . TO DO . . .</div>

9.2 Methods

9.2.1 The `split` Methods

<div align="center">. . . TO DO . . .</div>
